### PROFILE

Dr. Jane Doe is a highly regarded board certified cardiologist that has been actively practicing for over a decade in the New York area. As an experienced cardiac and pulmonary surgeon who has performed over 1,000 open-heart procedures, her primary interest has always been measuring and reducing the risk of cardiac surgery. She has authored/co-authored several publications in the field of cardiac pacing and electrophysiology. Her reviews and articles have appeared in the *American Journal of Cardiology*, *Circulation* and the *International Journal of Cardiology*. Currently, Dr. Doe divides her time between surgery, clinical practice and studying gender differences in platelet activation and acute coronary syndrome. Dr. Doe and her husband, also a physician, reside in New York City.

### WHITE PAPERS

Long Chain Omega-3 Fatty Acids in Human Health

The following is an excerpt from the "White Paper" issued by The Council for Responsible Nutrition (CRN) Washington, D.C., 2005 1-6. For heart health, the public has been urged for many decades to reduce consumption of saturated fats and replace them with unsaturated fats. Saturated fats are the solid fats that can be seen in many meat products, such as beef, pork, poultry and some plants such as coconut, palm fruit and palm kernel oil. Seed oils like cottonseed also have relatively high levels of saturated fat. In contrast, unsaturated fats are fluid at room temperature. They include monounsaturated fats (also known as omega-9 or oleic acid) that are present in olive oil, and the polyunsaturated fatty acids (PUFAs) present in many grains, nuts, plant oils, and fish. PUFAs fall into two classes, the omega-6 and the omega-3 fatty acids. The names indicate the chemical structure of these fatty acids, which have their first unsaturated bond (double bond) at carbon number 6 or carbon number 3, respectively, from the end of the chain.
